

Terra Stage — 3-Minute Pitch Script (Final)

Prepared for live presentation

Good afternoon, and welcome to our pitch. I'm Allegra Moscon, and we are Terra Stage.

Every year, millions pack into concerts, festivals, and city events chasing that electric feeling of being together.

But behind the excitement, there's a hidden risk: layouts planned by guesswork—heat islands with no shade, mud traps after rain, unclear exits that slow evacuation.

When you're planning for tens of thousands without seeing the ground truth, you're flying blind. That's the gap we're solving.

Problem

- Hosts face safety, compliance, and reputational risk because environmental hazards are invisible until it's too late.
- Attendees face zero network, zero orientation, and no simple way to reconnect with friends—just when it matters most.

Solution (Two Phases)

Terra Stage is a two-phase platform that brings space intelligence into event planning and the fan experience—before and during the show.

Phase 1 — Copernicus Risk Map

- Sentinel-2 — “The Eye”: Scene Classification to map grass, concrete, asphalt at 10m.
- Sentinel-1 — “The X-Ray”: Radar + soil moisture to flag mud-risk on wet grass.
- Sentinel-3 — “The Thermometer”: Land Surface Temperature to identify heat-risk on hard surfaces.

Asset Layer + Deliverables

- Hosts add temporary assets (Exits, Bars, Medical, Stages) with simple pins.
- Deliverables: an interactive Simulation Dashboard (Risk Zones + Assets) and a downloadable ESG-style PDF that proves safety and sustainability decisions are satellite-backed.

In short: Know Before You Go—place things right, avoid hazards, and walk in with evidence.

Phase 2 — The During-Event Smart Map (Fan Experience)

Smart Map — Offline-First

- A free, client-side web app the host shares with tickets.
- A week before the show, the app pre-downloads the Risk Map and the host's assets.
- On show day it's 100% offline-capable—no venue network required.

Smart Notifications (Pre-show)

- “Boots recommended—Sentinel-1 flags mud risk near Grass Parking.”
- “Stay hydrated—Sentinel-3 shows heat risk near Main Stage; use water points on the smart map.”

Feature 1 — Smart Navigation (Offline)

The app shows mud/heat zones on the cached map and lets fans choose safer paths around them, using landmarks the host already pinned.

Feature 2 — Private ‘Find My Friends’ (Offline Mesh)

- Private, peer-to-peer group mode that works without internet.
- Friends join a private group and share live locations locally.
- The app fuses: your location + your friend's location + the offline Copernicus Risk Map.
- Result: a “Safe Route” to your friend that avoids mud pits and heat zones—connection, comfort, and safety, all on one screen.

Why Terra Stage

- Proactive safety: prevent issues with space-grade data before day one.
- Offline-proof fan experience: guidance and reconnection even with no network.
- Evidence you can show: a dashboard and report stakeholders trust.
- Built for people: simple for hosts, simple for fans—high impact, low friction.

Close

Terra Stage: where crowd safety, comfort, and connection come together—powered by space, built for people. Thank you.
